Status Finished Started Thursday, 16 January 2025, 1:00 PM Completed Thursday, 16 January 2025, 1:13 PM Duration 13 mins 37 secs Question 1 Given an array of integers, reverse the given array in place Correct using an index and loop rather than a built-in function. Marked out of Example 1.00 arr = [1, 3, 2, 4, 5] Flag question Return the array [5, 4, 2, 3, 1] which is the reverse of the input **Function Description** Complete the function reverseArray in the editor below. reverseArray has the following parameter(s): int arr[n]: an array of integers Return int[n]: the array in reverse order Constraints $1 \le n \le 100$ $0 < arr[i] \le 100$ Input Format For Custom Testing The first line contains an integer, n, the number of elements in arr. Each line *i* of the *n* subsequent lines (where $0 \le i < n$) contains an integer, arr[i]. Sample Case 0 Sample Input For Custom Testing 5 1 3 2 4 5 **Sample Output** 5 4 2 3 1 Explanation The input array is [1, 3, 2, 4, 5], so the reverse of the input array is [5, 4, 2, 3, 1]. Sample Case 1 Sample Input For Custom Testing 4 17 10 21

Input Format For Custom Testing The first line contains an integer, *n*, the number of elements in arr. Each line *i* of the *n* subsequent lines (where $0 \le i < n$) contains an integer, arr[i]. Sample Case 0 **Sample Input For Custom Testing** 5 1 3 2 4 5 **Sample Output** 5 4 2 3 1 Explanation The input array is [1, 3, 2, 4, 5], so the reverse of the input array is [5, 4, 2, 3, 1]. Sample Case 1 Sample Input For Custom Testing 4 17 10 21 45 Sample Output 45 21 10 17 Explanation The input array is [17, 10, 21, 45], so the reverse of the input array is [45, 21, 10, 17].

Answer: (penalty regime: 0 %)

Question 2
Correct
Marked out of 1.00

Flag question

An automated cutting machine is used to cut rods into segments. The cutting machine can only hold a rod of minLength or more, and it can only make one cut at a time. Given the array lengths representing the desired lengths of each segment, determine if it is possible to make the necessary cuts using this machine. The rod is marked into lengths already, in the order given.

Example

The rod is initially sum(lengths) = 4 + 3 + 2 = 9 units long. First cut off the segment of length 4 + 3 = 7 leaving a rod 9 - 7 = 2. Then check that the length 7 rod can be cut into segments of lengths 4 and 3. Since 7 is greater than or equal to minLength = 7, the final cut can be made. Return "Possible".

Example

n = 3

lengths = [4, 2, 3] minLength = 7

The rod is initially sum(lengths) = 4 + 2 + 3 = 9 units long. In this case, the initial cut can be of length 4 or 4 + 2 = 6. Regardless of the length of the first cut, the remaining piece will be shorter than minLength. Because n - 1 = 2 cuts cannot

Function Description

be made, the answer is "Impossible".

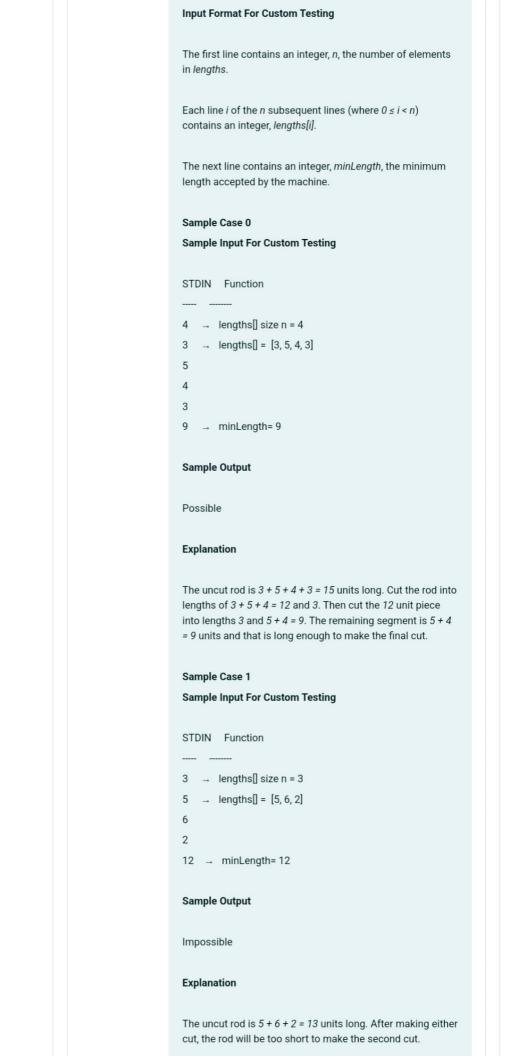

Complete the function cutThemAll in the editor below.

cutThemAll has the following parameter(s):
int lengths[n]: the lengths of the segments, in order
int minLength: the minimum length the machine can accept

Returns string: "Possible" if all *n-1* cuts can be made. Otherwise, return the string "Impossible".

Constraints

- $2 \le n \le 10^5$
- $1 \le t \le 10^9$
- 1 ≤ lengths[i] ≤ 10⁹
- The sum of the elements of lengths equals the uncut rod length.

Explanation

The uncut rod is 5 + 6 + 2 = 13 units long. After making either cut, the rod will be too short to make the second cut.

Answer: (penalty regime: 0 %)
